// Update & Patch Management

Unburden your IT & solve problems before they arise

The increasing diversity and complexity of IT infrastructures and ever shorter update intervals make it almost impossible for IT administrators to keep the entire software and hardware portfolio up to date and ensure secure business operations.

In 2021, over 25,000 software products were affected by at least one vulnerability – around 66 % of these were exploited by hackers and cybercriminals to cause damage.

To prevent this trend, automated processes are needed that enable fully comprehensive Update and Patch Management, relieve IT managers, and give cyber attacks no chance.

Spread of all vulnerabilities according to criticality

Source: NIST National Vulnerability Database
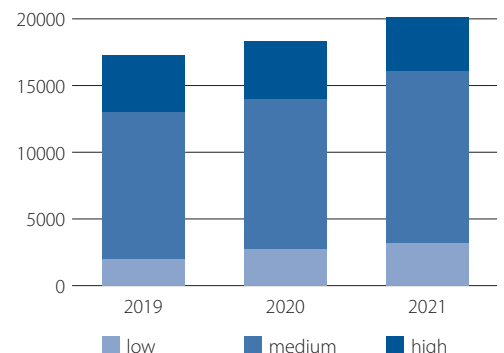

Show no mercy to dangerous vulnerabilities

With the innovative Update and Patch Management in RayManageSoft Unified Endpoint Manager, you not only gain complete transparency over all your IT assets, but rather the control over software updates and security patches.

Our technology catalog enriches your portfolio information with essential key figures on all known vulnerabilities including all levels of criticality.

The integration of the world's largest Package Store for ready-made software offers you a wide range of deployable third-party products for your systems.

Benefit from intelligent management of all endpoints on one central platform and ensure full security of your IT infrastructure.

Your benefits

- Get complete visibility over your hardware and software portfolio
- Improve your operating security by daily monitoring of software vulnerabilities
- Minimize your support efforts through proactive Update and Patch Management
- Unburden your IT infrastructure and reduce manual processes by using intelligent technologies
- Third-party patching thanks to integration of the world's largest Package Store
